

Create stunning and professional quality mugs using the Infusible Ink markers or bring your own Infusible Ink sheets. Your finished project will be dishwasher safe!

- 1** Ensure that you are using a mug that is labelled acceptable for "Sublimation". Mugs will have to have a sublimation coating in order to accept the heat transfer.
- 2** Use Design Space to create a design, draw something using the Infusible Ink markers, or cut out a design on an Infusible Ink sheet.
- 3** Handle the surface of the mug as little as possible to avoid transferring oils from your hands. Lint roll or wipe with an alcohol cloth to remove debris or oils.
- 4** Carefully wrap your design around the mug with the design facing in.
- 5** Wrap at least two layers of copy paper or butcher paper around the design of the mug to prevent ink from bleeding. Cut this paper close to the top and bottom of the mug to avoid unnecessary burning or scorching.
- 6** Wrap the mug in heat resistant tape. Seal anywhere that gasses might escape from your design.
- 7** Place the mug inside the machine and press the lever down completely. Ensure that the heat plate covers the design. The machine will beep when your design is finished heating.
- 8** It is very important to not touch your design. Handle the mug only by the handle and leave the wrapping on until the mug has cooled completely. This will prevent smudging.
